## Note to Readers

Readers should interpret the results from this survey with caution. It was expected that this survey would be repeated in order to give a trajectory of prevalence over a period of time. Statisticians would expect the resultant trajectory to exhibit a certain amount of variation from one year to another around an underlying trend. This would be attributable to statistical variation due to sampling variation and random factors. We would normally expect to combine data from annual surveys in order to give a 'smoothed' line of prevalence over time.

In particular, it would be inappropriate to use as an indicator of performance of commissioning or provider organisations due to the amount of variability within a single year.

We urge people reading this report to consider these factors and invite them to contact us if they would like further information:
publichealthintelligence@hullcc.gov.uk

## 1 Executive Summary

Background: In 2009 an adult (18+ years) Health and Wellbeing Survey was commissioned by the Public Health Intelligence team within Hull City Council (who were in Hull Teaching Primary Care Trust (PCT) at the time of this survey). The survey had a target of 1,750 respondents, with the aim to examine health status and health related behaviour in a representative sample of Hull's adult population.

Health: Around three quarters of respondents (76.5\% of men and 73.9\% of women) reported having excellent, very good or good health, whilst reporting of poor health roughly doubled between 2007 and 2009 (from 4.6\% to 9.7\%). Over a fifth of survey respondents reported that their activities were limited in some way by long-term illness or disability ( $22.1 \%$ of men and $20.6 \%$ of women). A higher percentage of respondents in the most deprived quintile had a low mental health index (29.6\%), denoting poor mental health, compared to those in the least deprived quintile (16.5\%).

Diet: Over three-quarters of respondents said they ate a healthy diet, a higher percentage of women (82.5\%) compared to men (76.1\%). 5-A-DAY fruits and vegetables consumption was lower for men but higher for women compared to England (22\% of men and 31\% of women for Hull compared to $25 \%$ of men and $29 \%$ of women for England). Fruits and vegetables consumption was lowest in those aged 18-24 years (14.3\%) and highest in those aged 65-74 years (34.3\%).

Alcohol: Around a quarter of survey respondents never drink alcohol, a lower percentage of men (17.1\%) compared to women (31.0\%). A higher proportion of male drinkers binge drink (33\%) compared to England (26\%), with the percentage binge drinking and staying within the recommended weekly guidelines over double the percentage for England. The percentage of female drinkers binge drinking was lower (18\%) compared to England (22\%), although the percentage drinking within the recommended weekly limits and binge drinking was higher (11\%) compared to England (9\%).

Smoking: The prevalence of smoking among respondents is considerably higher compared to England ( $38 \%$ of men and $32 \%$ of women for Hull compared to $24 \%$ of men and $20 \%$ of women for England). There was an $11 \%$ increase in smoking prevalence between 2007 and 2009, with over half of survey respondents in the most deprived quintile smoking (53.7\%), compared to a fifth ( $20.1 \%$ ) in the least deprived quintile. Of those survey respondents who smoked cigarettes, $31.2 \%$ were heavy smokers, smoking on average at least 20 cigarettes per day. However, due to smaller sample size and random variation inherent in all survey samples, it is not known if the increase is real or due to random variation.

Exercise: Exercise levels are lower among respondents compared to England (36\% of men and 26\% of women exercise to national guideline levels compared to $39 \%$ of men and 29\% of women for England). 7.6\% of men and $6.2 \%$ of women never exercise. West locality had the highest percentage of residents that exercised to guideline levels (34.9\%) compared to East (28.6\%) and North (26.5\%) localities.

Obesity: The proportion of male respondents that are overweight or obese has stayed virtually the same between 2007 and 2009 ( $66.9 \%$ and 67.0\% respectively), but marginally above England (65.9\%). Among women the overall percentage overweight or obese saw a $6.6 \%$ increase to $59.5 \%$ between 2007 and 2009, again above England (56.9\%). A similar percentage of men ( $24.2 \%$ ) and women ( $24.6 \%$ ) were obese, virtually the same for men and women compared to England (24.1\% and 24.9\% respectively).

Employment: The percentage of respondents of working age in employment was $60.4 \%$, a decrease of $11.2 \%$ between 2003 and 2009, below the Yorkshire and Humber Region (73.0\%) and England (72.7\%). The percentage of working age men economically inactive due to long-term sickness or disability was the same as the UK (34\%), whilst for women the percentage was lower ( $16 \%$ compared to $19 \%$ for the UK).

## 2 Introduction

The aim of the 2009 Health and Wellbeing Survey was to examine health status and health related behaviour in a representative sample of Hull's adult (18 years and over) population. A number of surveys have been undertaken in Hull so that results can be compared over time. However, the current survey undertaken in 2009 involved a much smaller questionnaire and just focused on a small number of questions concentrating on health status and the prevalence of key public health risk factors for poor health. As a result, it has been also referred to as a Prevalence Survey. Differences between various demographic, socio-economic and lifestyle factors can be examined. Any differences can be quantified, and the results will be used to help improve/redefine services to reduce the impact of any inequalities, and to improve services for all. The Public Health Intelligence team within at the Hull Teaching Primary Care Trust (now at Hull City Council) undertook all aspects of the survey with the exception of the fieldwork and data entry which were completed by Information by Design (lbyD). For further information on these surveys visit www.hulljsna.com.

## 3 Methods

### 3.1 Survey sample

In 2009 an adult (18+ years) Health and Wellbeing Survey was commissioned by the Public Health Intelligence team at Hull Teaching Primary Care Trust (PCT). The survey had a target of 1,750 respondents, each being a Hull resident. Interviews were completed through interviewers knocking on doors. Quota ${ }^{1}$ sampling was used so that the resulting sample was broadly representative of Hull's overall population.

[^0]
### 3.2 Survey methodology

Using quota sampling for the Health and Wellbeing Survey meant that the resulting sample was similar to Hull's overall population in terms of age, gender and geographic structure. For the quota, 10-year age bands (18-24, 25-34, 35-$44,45-54,55-64,65-74$ and $75+$ years) and nine geographical areas were used. The areas used were based on the seven Area Committee Areas used by the Hull City Council, with Bransholme East and Bransholme West separated from King's Park in the North Carr Area, and Drypool ward examined separately as whilst it was in the Riverside Area, it was in East Locality (area used by NHS Hull). The quota also involved employment status, so that people from the whole range of employment groups were included in the survey. Survey respondents were targeted through interviewers knocking on doors in specific geographical areas to obtain the sample.

### 3.3 Data Considerations

### 3.3.1 Questionnaire content

The questionnaire was divided into two sections. Section 1 related to general health. This section included questions enabling the production of several measures of health status, including the SF-36 mental health index (MHI), as well as risk factor information on diet, alcohol, smoking and exercise. Section 2 collected information about the survey respondents. This included demographic information, as well as ethnicity and employment status.

### 3.3.2 Measures of health status

A range of measures of health status were used in the questionnaire. Question 2 (illness or disability which has lasted more than a month, and has limited activities in any way) is the same question used in the 2001 Census, and the responses from the survey responders can be compared with the results from the Census for residents in Hull.

The Mental Health Index (MHI) measures "general mental health, including depression, anxiety, behavioural-emotional control, general positive affect" and is part of another health-related scoring measure (the SF36). The MHI ranges from 5 to 25 or from 0 to 100 for the transformed MHI with a high score denoting better mental health.

### 3.3.3 Alcohol

Question 7 asked for the number of alcoholic drinks consumed in the last 7 days by type of drink. These were later converted to units (Table 3.1).

Table 3.1: Units of alcohol assumed for each type of alcoholic drink

| Type of drink | Size of drink | Units |
| :--- | :--- | :---: |
| Ordinary beer, lager or cider | Pint (568ml) | 2 |
| Ordinary beer, lager or cider | Standard can (440ml) | 1.5 |
| Ordinary beer, lager or cider | Small can (330ml) | 1.1 |
| Strong beer, lager or cider | Pint (568ml) | 4 |
| Strong beer, lager or cider | Standard can (440ml) | 3 |
| Strong beer, lager or cider | Small can (330ml) | 2.3 |
| Wine | Glass-pub measure | 2 |
| Wine | Large glass | 3 |
| Wine | Bottle | 9 |
| Sherry/Spirits | Glass-pub measure (50ml) | 1 |
| Sherry/Spirits | Glass-home measure (50ml) | 1.4 |
| Alcopops | Bottle | 1.5 |

### 3.3.4 Height, weight and body mass index (BMI)

Information collected on height and weight was self-reported rather than measured by researchers (as is the case for the Health Survey for England data). From research ${ }^{2}$, it is well known that both men and women, in general, overestimate their height and under estimate their weight. Therefore it is difficult to compare the percentage of people classified as overweight or obese locally with those in England, because of these differences in the data collection method. In order to enable a more valid comparison, the self-reported heights and weights have been adjusted ${ }^{3}$ to give an adjusted BMI figure for each survey respondent. Unadjusted self-reported heights and weights are available on request.

[^1]The effect of these changes is to increase the percentage of overweight and obese people in the local survey from $34.9 \%$ and $19.9 \%$ respectively to $38.9 \%$ and $24.4 \%$ respectively (Table 3.2). Of the 631 respondents who self-reported they were desirable weight, 142 ( $23 \%$ ) were overweight following the adjustment. This shows even a relatively small adjustment of $1-2 \mathrm{~cm}$ and $1-2 \mathrm{~kg}$ can make a considerable difference to the prevalence of overweight and obesity. In the rest of this report the Adjusted BMI figures will be used unless otherwise stated; 83 respondents' heights and weights were not given and therefore excluded from the BMI analysis.

Table 3.2: Adjustment of body mass index to take into account that height is overestimated and weight is underestimated when self-reported changes in BMI categorisation

|  |  | Body mass index (adjusted) |  |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | Desirable <br> weight | Over- <br> weight | Obese | Total |  |
| Body <br> mass <br> index <br> (self- <br> reported) | Under- <br> weight | Desirable <br> weight | Over- <br> weight | 0 | 47 | 0 |
|  | 489 | 142 | 0 | 631 |  |  |
|  | Obese | 0 | 0 | 507 | 75 | 582 |
|  | Total | 75 | 536 | 649 | 407 | 1,667 |

## Geography

Each survey respondent was assigned to a ward, Area Committee Area and locality within Hull on the basis of their postcode. Five postcodes provided did not match to any records in the current postcode lookup table, but were assigned to a ward from information recorded by Information by Design interviewers. None of the five records with non matching postcodes had a deprivation quintile assigned, as this needs a full and valid postcode.

## 4 Demographics

### 4.1 Age and gender

Table 4.1 displays the population structure of survey respondents. Males make up $50.1 \%$ of the survey population compared to $50.6 \%$ of the Hull October 2009 adult population. Females make up $49.9 \%$ of the survey population compared to $49.4 \%$ of the Hull October 2009 adult population. Survey underrepresentation (an absolute difference of more than $1 \%$ to the Hull adult population) was seen in ages 25-29 years and 45-49 years, with no overrepresentation in any age band.

Table 4.1: Age and gender of survey respondents, with proportions in each age group (persons) for survey and Hull (October 2009)

| $*$ <br> (years) | Gender |  |  |  | All |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Males |  | Females |  | Survey | Hull |
|  | $\mathbf{n}$ | $\%$ | $\mathbf{n}$ | $\%$ | $\%$ | $\%$ |
| $18-19$ | 40 | 4.6 | 35 | 4.0 | 4.3 | 3.7 |
| $20-24$ | 95 | 10.8 | 96 | 11.0 | 10.9 | 11.1 |
| $25-29$ | 79 | 9.0 | 69 | 7.9 | 8.5 | 10.0 |
| $30-34$ | 80 | 9.1 | 85 | 9.7 | 9.4 | 8.7 |
| $35-39$ | 88 | 10.0 | 88 | 10.1 | 10.1 | 9.3 |
| $40-44$ | 88 | 10.0 | 70 | 8.0 | 9.0 | 9.3 |
| $45-49$ | 66 | 7.5 | 74 | 8.5 | 8.0 | 9.1 |
| $50-54$ | 81 | 9.2 | 58 | 6.6 | 7.9 | 7.7 |
| $55-59$ | 61 | 7.0 | 58 | 6.6 | 6.8 | 6.9 |
| $60-64$ | 62 | 7.1 | 62 | 7.1 | 7.1 | 6.6 |
| $65-69$ | 40 | 4.6 | 44 | 5.0 | 4.8 | 4.6 |
| $70-74$ | 39 | 4.4 | 43 | 4.9 | 4.7 | 4.4 |
| $75-79$ | 23 | 2.6 | 48 | 5.5 | 4.1 | 3.7 |
| $80-84$ | 17 | 1.9 | 27 | 3.1 | 2.5 | 2.6 |
| $85+$ | 18 | 2.1 | 15 | 1.7 | 1.9 | 2.2 |
| Age missing |  |  | 1 | 0.1 | 0.1 | - |
| Totals |  |  |  |  |  |  |
| Survey | $\mathbf{8 7 7}$ | $\mathbf{5 0 . 1}$ | $\mathbf{8 7 3}$ | $\mathbf{4 9 . 9}$ | $\mathbf{1 7 5 0}$ | - |
| Hull | $\mathbf{1 0 4 , 7 9 7}$ | $\mathbf{5 0 . 6}$ | $\mathbf{1 0 2 , 2 5 7}$ | $\mathbf{4 9 . 4}$ | - | $\mathbf{2 0 7 , 0 5 4}$ |

Figure 4.1 displays the population pyramid of survey respondents with a population line representing the Hull adult population (October 2009). The population line is broadly similar to the pyramid for males and females.

Figure 4.1: Main survey respondents and Hull adult population (October 2009) population pyramid

### 4.2 Geographical distribution

Figure 4.2 illustrates the geographical distribution of survey respondents. Respondents were found from each ward (and therefore Area Committee Area and locality) in Hull, as expected given that geography was included in the quota. There appears to be a reasonable distribution of survey respondents across Hull, with a limited number of survey respondents around Marfleet because of the industrial area and no residents up through the river. The points are plotted in relation to postcode (midpoint of the postcode area), with the possibility of more than one survey responder at any particular postcode.

Figure 4.2: Geographical spread of survey respondents

Looking at a breakdown by area, and comparing this with the Hull adult population (Table 4.2) the percentage of respondents by area was similar for survey respondents and the Hull adult population. There was no significant (an absolute difference of more than $1 \%$ to the Hull adult population) survey under or over representation by locality. Wyke Area Committee Area was over represented in the survey ( $14.5 \%$ compared to $13.2 \%$ for Hull).

Table 4.2: Area Committee Area and locality of survey respondents and Hull adult population (October 2009)

| Area Committee <br> Area/locality | Number | Proportion |  |
| :--- | :---: | :---: | :---: |
|  |  | Survey | Hull |
| North Carr | 167 | 9.5 | 10.2 |
| Northern | 225 | 12.9 | 12.8 |
| North Locality | 392 | $\mathbf{2 2 . 4}$ | $\mathbf{2 2 . 9}$ |
| East | 255 | 14.6 | 14.5 |
| Park | 295 | 16.9 | 16.2 |
| Riverside (East) | 84 | 4.8 | 4.9 |
| East Locality | $\mathbf{6 3 4}$ | $\mathbf{3 6 . 2}$ | $\mathbf{3 5 . 7}$ |
| Riverside (West) | 243 | 13.9 | 14.2 |
| West | 228 | 13.0 | 14.0 |
| Wyke | 253 | 14.5 | 13.2 |
| West Locality | $\mathbf{7 2 4}$ | $\mathbf{4 1 . 4}$ | $\mathbf{4 1 . 4}$ |
| Hull | $\mathbf{1 7 5 0}$ | $\mathbf{-}$ | $\mathbf{-}$ |

A similar comparison of local deprivation quintiles (Table 4.3) shows that four out of the five deprivation quintiles (based on local quintiles of the IMD20074) were under-represented, with the fourth deprivation quintile over represented ( $27.3 \%$ compared to $19.6 \%$ for Hull).

Table 4.3: Deprivation quintile (Hull) of survey respondents

| Deprivation <br> quintile | Number of <br> respondents | Proportion |  |
| :---: | :---: | :---: | :---: |
|  | Survey | Hull |  |
| Most deprived | 307 | 17.5 | 19.3 |
| 2 | 331 | 18.9 | 19.8 |
| 3 | 321 | 18.3 | 20.6 |
| 4 | 477 | 27.3 | 19.6 |
| Least deprived | 309 | 17.7 | 20.6 |
| Missing ${ }^{5}$ | 5 | 0.0 | - |

[^2]
## 5 Results

### 5.1 Health

### 5.1.1 Mental health Index

Figure 5.1 shows a larger percentage of men have a mental health transformed score of $86-100$ ( $49.9 \%$ ) compared to women ( $42.7 \%$ ). The overall median mental health transformed score was 85, although higher in men (90). 21.4\% of women scored $0-60$, compared with $17.6 \%$ of men. Those aged $25-44$ years had the highest percentage of respondents ( $50.1 \%$ ) with a score of $86-100$, whilst respondents over 75 years had the lowest score ( $38.5 \%$ ). Those aged 18-24 years had the lowest median score of 80, whilst ages 45-64 years had the highest median score of 90 .

Figure 5.1: Mental health transformed (0-100) scale gender

North locality had the highest percentage of respondents with a score of 0-60 (21.2\%), compared with East (19.7\%) and West localities (18.4\%). All three localities had a similar percentage of respondents with a score of 86-100. The median score was the same by locality (85). Four Area Committee Areas had a different median score from the Hull median, including North Carr, Riverside (East) and West, all with a higher median score of 90. Northern Area Committee Area had a lower median score of 80. By deprivation quintile (Figure 5.2) the most deprived quintile had the lowest percentage of respondents with a score of 86-100 (41.4\%) and largest percentage scoring 0-60 (29.6\%), with the lowest overall median score of 80 . The least deprived quintile had the highest percentage of respondents scoring 86-100 (50.2\%), with $16.5 \%$ scoring 0-60 and an overall median score of 90 . This could explain the higher percentage of respondents in North locality with poor mental health, as $45.4 \%$ of respondents in North locality are in the two most deprived quintiles, compared to $36.1 \%$ and $32.2 \%$ in East and West localities respectively.

Figure 5.2: Mental health transformed (0-100) scale by deprivation quintile

Tables of the mental health transformed (0-100) scale broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 6.4 on page 76.

### 5.1.2 Self-reported health status

A larger percentage of men reported excellent health (12.1\%) compared to women ( $9.4 \%$ ), with a similar percentage of males and females reporting very good or good health. The percentage of respondents reporting excellent or very good health decreased in those aged over 44 years (see Figure 5.3), with $15.5 \%$ and $33.8 \%$ of those aged $25-44$ years reporting excellent or very good health respectively, compared to $4.1 \%$ and $12.2 \%$ respectively of those aged over 75 years. Conversely, the percentage of respondents reporting fair or poor health increased with increasing age.

Figure 5.3: Self-reported health statues by age band

West locality had the highest percentage of residents reporting excellent health (11.9\%), whilst North locality had the highest percentage reporting very good health (29.8\%). East locality had the highest percentage of respondents reporting fair or poor health ( $16.6 \%$ and $10.9 \%$ respectively). A potential explanation for this is that East locality has an older population, with $19.4 \%$ of residents aged over 64 years compared to $17.7 \%$ and $16.1 \%$ of residents in West and North localities respectively.

The percentage of respondents reporting excellent or very good health increased as deprivation decreased (see Figure 5.4), from 8.1\% and 20.5\% respectively in the most deprived quintile to $12.6 \%$ and $37.2 \%$ respectively in the least deprived quintile. The percentage of respondents reporting fair or poor health decreased with decreasing deprivation, from $17.3 \%$ and $14.0 \%$ respectively in the most deprived quintile to $10.0 \%$ and $7.1 \%$ respectively in the least deprived quintile.

Figure 5.4: Self-reported health status by deprivation quintile

Table 5.1 displays the changes in self-reported health status between the 2007 and 2009 Health and Wellbeing Surveys. The percentage of men reporting excellent health in 2007 (13.1\%) was higher compared to 2009 (12.1\%), similarly for women a higher percentage reported excellent health in 2007 (10.3\%) compared to 2009 ( $9.4 \%$ ). The percentage of respondents reporting poor health roughly doubles for males and females between 2007 and 2009. The rise in reporting of poor health could be the consequence of sampling and random variation, however if the decline in health is a genuine reflection of the Hull population, one possible explanation could be the change in economic climate between surveys.

Table 5.1: Self-reported health status by gender, comparisons with 2007 Health and Wellbeing Survey

| Gender <br> and <br> survey | Number of <br> respondent <br> s | Self-reported health status (\%) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Excellent | Very <br> good | Good | Fair | Poor |
| 2007 | 1,932 | 13.1 | 31.6 | 35.5 | 14.8 | 5.0 |
| 2009 | 877 | 12.1 | 27.3 | 37.0 | 14.2 | 9.4 |
| Females |  |  |  |  |  |  |
| 2007 | 2,067 | 10.3 | 31.7 | 35.6 | 18.0 | 4.4 |
| 2009 | 873 | 9.4 | 27.1 | 37.3 | 16.2 | 10.0 |

The percentage of respondents reporting poor health has increased across all ages between 2007 and 2009 (see Figure 5.5), the largest increase in those aged over 75 years. For ages 25-44 years there has been an increase in the percentage reporting excellent health, accompanied by an increase in ages 1824 years reporting good health. However there are decreases in all remaining age bands for excellent and good health.

Figure 5.5: Self-reported health status by age band, comparisons with 2007 Health and Wellbeing Survey

Figure 5.6 shows a decrease between 2007 and 2009 in four out of the five deprivation quintiles for the percentage of respondents reporting excellent health, the second least deprived quintile being the exception. Reporting of good health decreased in four out of the five quintiles, with the least deprived quintile being the exception. This is reflected with an increase in the reporting of poor health across all deprivation quintiles for 2009.

Figure 5.6: Self-reported health status by deprivation quintile, comparisons with 2007 Health and Wellbeing Survey

Tables of self-reported health status broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 6.1 on page 71.

### 5.1.3 Long-term illness and disability

Over a fifth of all survey respondents reported that their activities were limited in some way by long-term illness or disability (22.1\% of men and $20.6 \%$ of women). There was a strong association between limiting of activities due to long-term illness or disability and age (see Figure 5.7), with $5.3 \%$ of those aged 18-24 years having activities limited by long-term illness or disability, compared to $43.9 \%$ of those aged over 75 years.

Figure 5.7: Percentage of respondents with activities limited by longterm illness or disability by age band

As a proportion of all respondents North locality had the highest percentage of respondents with activities limited by long-term illness or disability (24.5\%), followed by East (20.8\%) and West (20.2\%). By Area Committee Area percentages ranged from 11.5\% of residents in Wyke Area Committee Area limited by long-term illness or disability, to $28.8 \%$ in Riverside (West) Area Committee Area. Figure 5.8 indicates association between long-term illness or disability and deprivation, $30.6 \%$ of respondents in the most deprived quintile had activities limited by long-term illness or disability, compared to $18.4 \%$ in the least deprived quintile. $23.3 \%$ and $24.0 \%$ in the second most deprived and middle quintile respectively had activities limited by long-term illness or disability. As North locality is the most deprived locality within Hull this could explain the higher percentage of residents with activities limited by long-term illness or disability.

Figure 5.8: Percentage of respondents with activities limited by longterm illness or disability by deprivation quintile

Comparing the 2007 and 2009 Health and Wellbeing Surveys (Table 5.2) the overall percentage of respondents reporting activities limited by long-term illness or disability decreased between 2007 and 2009. This decrease is attributable to female respondents, with males seeing a $2 \%$ increase, whilst females saw an 18\% decrease. Ages 18-44 years saw an increase between 2007 and 2009, whilst ages over 45 years saw a decrease. All deprivation quintiles saw a decrease between 2007 and 2009 (with the exception of the middle quintile) in the percentage of respondents reporting activities limited by long-term illness or disability. The most deprived and second most deprived quintiles had the smallest decreases ( $7 \%$ and $5 \%$ respectively), with the second least and least deprived quintiles having the largest decreases (32\% and 16\% respectively). Interestingly the reporting of poor health has increased between 2007 and 2009, whilst reporting of activities limited by long term illness or disability has fallen.

Table 5.2: Percentage of respondents with activities limited by long-term illness or disability, by sub groups, comparisons with 2007 Health and Wellbeing Survey

| Subgroup | Number of respondents |  | Activities limited by long-term illness or disability (\%) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2007 | 2009 | 2007 | 2009 |
| Gender |  |  |  |  |
| Males | 1,965 | 877 | 21.6 | 22.1 |
| Females | 2,054 | 872 | 25.2 | 20.6 |
| Age band |  |  |  |  |
| 18-24 years | 558 | 265 | 4.7 | 5.3 |
| 25-44 years | 1,480 | 647 | 12.3 | 13.8 |
| 45-64 years | 1,134 | 522 | 32.1 | 28.7 |
| 65-74 years | 467 | 166 | 42.6 | 33.7 |
| 75+ years | 356 | 148 | 47.2 | 43.9 |
| Deprivation |  |  |  |  |
| Most deprived quintile | 656 | 307 | 32.9 | 30.6 |
| Quintile 2 | 519 | 331 | 24.5 | 23.3 |
| Quintile 3 | 747 | 321 | 20.2 | 24.0 |
| Quintile 4 | 1,037 | 476 | 20.9 | 14.3 |
| Least deprived quintile | 881 | 309 | 21.9 | 18.4 |
| Locality |  |  |  |  |
| North | 816 | 392 | 27.7 | 24.5 |
| East | 1,539 | 634 | 21.8 | 20.8 |
| West | 1,664 | 723 | 22.8 | 20.2 |
| Hull | 4,019 | 1749 | 23.4 | 21.4 |

Tables of respondents with long term illness and activities limited by long-term illness or disability broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in sections 6.2 and 6.3 on pages 72 and 74.

### 5.2 Diet

### 5.2.1 Healthy diet and 5-A-DAY fruits and vegetables guidelines

Over three-quarters of respondents said they ate a healthy diet (Figure 5.9), a higher percentage of women ( $82.5 \%$ ) compared to men ( $76.1 \%$ ). 2.2\% of respondents did not know if they had a healthy diet and $0.5 \%$ did not know what a healthy diet is. Roughly a quarter of respondents ate five or more portions of fruits and vegetables per day (26.1\%), again with a higher percentage of women (30.5\%) compared to men (21.8\%).

Figure 5.9: Healthy diet eaten and 5-A-DAY target met, by gender

Comparing the 2007 and 2009 Health and Wellbeing Surveys (Table 5.3), the percentage of men eating a healthy diet has increased by $9 \%$ to $76.1 \%$ between 2007 and 2009, among women there was a $4 \%$ increase to $82.5 \%$. It is encouraging that the percentage of men not knowing what constituted a healthy diet decreased from $2.5 \%$ to $0.6 \%$ between 2007 and 2009, with women also seeing a decrease from $1.1 \%$ to $0.5 \%$. The percentage of respondents not knowing if they eat a healthy diet fell from $6.8 \%$ to $2.1 \%$ for men, and $4.7 \%$ to 2.4\% for women.

Table 5.3: Healthy diet by gender, comparisons with 2007 Health and Wellbeing Survey

| Gender | Number of <br> respondents | Eat a healthy diet (\%) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | No | Don't <br> know $^{6}$ | Don't <br> know |  |  |
|  |  |  |  |  |  |  |
| 2007 | 1,981 | 69.9 | 20.8 | 2.5 | 6.8 |  |
| 2009 | 875 | 76.1 | 21.3 | 0.6 | 2.1 |  |
| Females |  |  |  |  |  |  |
| 2007 | 2,084 | 79.3 | 15.0 | 1.1 | 4.7 |  |
| 2009 | 868 | 82.5 | 14.6 | 0.5 | 2.4 |  |

Figure 5.10 shows the percentage of respondents by age band that eat a healthy diet and eat at least five portions of fruits and vegetables a day. The percentage eating a healthy diet increased as age increased, those aged 1824 years had the lowest percentage of respondents who eat a healthy diet (67.5\%), whilst those aged over 75 years had the highest ( $95.9 \%$ ). Those aged $18-24$ years were the most likely not to know what a healthy diet was ( $0.8 \%$ ), although this is a small percentage and a similar number to the majority of the age bands. Ages 18-24 years were also the most likely to not know whether they had a healthy diet (3.8\%), whilst ages 65-74 years were the most unlikely ( $0.6 \%$ ). Fruit and vegetable consumption was lowest in those aged $18-24$ years (14.3\%) and highest in those aged 65-74 years (34.3\%), showing a similar trend to respondents who eat a healthy diet, increasing with increasing age, with the exception of respondents aged over 75 years.

Figure 5.10: Healthy diet eaten and 5-A-DAY target met, by age band

[^3]Table 5.4 compares the 2009 Health and Wellbeing Survey with the 2008 Health Survey for England by percentage of respondents who consume 5 or more portions of fruits and vegetables a day. The percentage of men eating 5 or more portions of fruits and vegetables a day was lower (22\%) compared to England (25\%). The percentage of women eating five or more portions of fruits and vegetables a day was higher (31\%) compared to England (29\%). It should be noted the Health Survey for England includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.4: Portions of fruits and vegetables per day by gender, comparisons with 2008 Health Survey for England ${ }^{8}$

| Gender | 5 or more portions of fruits and vegetables per day (\%) |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Age band |  |  |  |  |  |  |  |
|  | 18-24 | 25-34 | 35-44 | 45-54 | 55-64 | 65-74 | 75+ |  |
| Males |  |  |  |  |  |  |  |  |
| England 2008 | 18 | 26 | 23 | 26 | 32 | 30 | 23 | 25 |
| Hull 2009 | 12 | 17 | 26 | 24 | 28 | 25 | 19 | 22 |
| Females |  |  |  |  |  |  |  |  |
| England 2008 | 21 | 28 | 30 | 33 | 36 | 29 | 24 | 29 |
| Hull 2009 | 17 | 31 | 30 | 32 | 32 | 43 | 37 | 31 |

By locality of residence, West locality (81.3\%) had the highest percentage of residents that eat a healthy diet, compared with North (78.1\%) and East (77.7\%) localities. All localities had a similar percentage of respondents who didn't know what a healthy diet is. North locality had the highest percentage of residents not knowing if they eat a healthy diet (2.8\%), with West locality having the lowest (1.8\%). By Area Committee Area percentages ranged from $86.8 \%$ in West Area Committee Area, to $73.8 \%$ in Riverside (East) Area Committee Area. Fruit and vegetable consumption was greatest in West locality with $27.8 \%$ of residents eating five or more portions of fruits and vegetables a day, compared to $25.4 \%$ in East locality and $24.2 \%$ in North locality. $32.9 \%$ of residents in West Area Committee Area ate five or more portions of fruits and vegetables a day compared to $22.0 \%$ in Park Area Committee Area. A possible explanation for the difference in diet between localities could be differing levels of deprivation, with West locality the least deprived out of the three localities. Another possible explanation could be the greater ethnic diversity within West locality (see page 69), allowing for greater consumption of and access to fresh foods.

[^4]Figure 5.11 shows the percentage of respondents by deprivation quintiles that eat a healthy diet and at least five portions of fruits and vegetables. The percentage of respondents who eat a healthy diet increases as deprivation decreases, with $72.0 \%$ in the most deprived quintile eating a healthy diet compared to $84.4 \%$ in the least deprived quintile. The percentage of respondents who do not know if they have a healthy diet is highest in the second most deprived quintile (3.3\%) and lowest in the least deprived quintile (1.6\%). Fruit and vegetable consumption was lowest in the most deprived quintiles, with $21.8 \%$ of respondents in the two most deprived quintiles combined eating five or more portions of fruits and vegetables compared to $28.7 \%$ of respondents in quintiles three, four and five combined.

Figure 5.11: Healthy diet eaten and 5-A-DAY target met, by deprivation quintile

Comparing diet in the 2007 and 2009 Health and Wellbeing Surveys (Figure 5.12) by deprivation, there was an increase in the percentage of respondents eating a healthy diet between 2007 and 2009 across all quintiles. Encouragingly the largest increases are seen in the second most (16.9\%) and most (14.3\%) deprived quintiles, with the smallest increase in the least deprived quintile (1.4\%). There was a decrease across all deprivation quintiles in 2009 for the percentage of respondents that don't know what a healthy diet is, and percentage of respondents that don't know if they eat a healthy diet.

Figure 5.12: Healthy diet by deprivation quintile, comparisons with 2007 Health and Wellbeing Survey

The results of the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{9}$ (which included questions on risk factors amongst other questions) are combined (see Table 5.5) in order to give a greater degree of precision due to the larger sample size, with a total of 5,757 respondents. This process means that the 2009 surveys can be reliably compared both with the results from the 2007 Health and Wellbeing Survey as well as with the most recent Health Survey for England. The percentage of adults reporting eating 5-A-DAY fruits and vegetables increased in 2009. The percentage among Hull men equalled that for England, while in women it was 10\% higher than England.

Table 5.5: 5-A-DAY target met from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{10}$, adjusted for age

| Survey | Age-adjusted percentages |  |  |
| :--- | :---: | :---: | :---: |
|  | Men | Women | All |
| Hull 2007 | $21 \%$ | $25 \%$ | $23 \%$ |
| Hull 2009 | $25 \%$ | $32 \%$ | $28 \%$ |
| England 2008 | $25 \%$ | $29 \%$ | $27 \%$ |

Tables of respondents who eat a healthy diet and portions of fruits and vegetables consumed broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in sections 7.1 and 7.2 on pages 79 and 81.

[^5]
### 5.3 Alcohol

### 5.3.1 Frequency of alcohol consumption

Around a quarter of survey respondents never drink alcohol (24.1\%), with a significantly lower percentage of men (17.1\%) never drinking alcohol compared to women ( $31.0 \%$ ). This is reflected with a higher percentage of men drinking regularly compared to women, with $9.1 \%$ of men compared to $3.4 \%$ of women drinking everyday and $7.1 \%$ of men compared to $2.2 \%$ of women drinking 4-6 days a week. This data is presented in Table 5.6, alongside data from the 2007 Health and Wellbeing Survey and national data from the 2008 General Household Survey. It should be noted the General Household Survey includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.6: Frequency of alcohol consumption by gender, comparisons with 2007 Health and Wellbeing Survey and 2008 General Household Survey ${ }^{11}$

| Gender | How often do you (on how many days last week did you) drink alcohol? (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Everyday <br> (7 days) | $\begin{aligned} & \text { 4-6 dpw }{ }^{12} \\ & \text { (4-6days) } \end{aligned}$ | $\begin{aligned} & \text { 1-3 dpw } \\ & \text { (1-3days) } \end{aligned}$ | $\begin{gathered} 1-3 \\ \mathrm{dpm}^{13} \end{gathered}$ | $\begin{gathered} <1 \\ \text { dpm } \end{gathered}$ | Never |
| Males |  |  |  |  |  |  |
| Hull 2007 | 9 | 10 | 34 | 17 | 13 | 17 |
| Hull 2009 | 9 | 7 | 41 | 14 | 11 | 17 |
| England 2008* | 11 | 17 | 44 | - | - | 29 |
| Females |  |  |  |  |  |  |
| Hull 2007 | 2 | 5 | 26 | 20 | 22 | 25 |
| Hull 2009 | 3 | 2 | 29 | 16 | 18 | 31 |
| England 2008* | 6 | 10 | 39 | - | - | 44 |

*General Household Survey defines those that drink less than one day per month as never drinking.

[^6]Between 2007 and 2009 the percentage of respondents drinking everyday remained the same for males (9\%), but increased for females from $2 \%$ to $3 \%$, both percentages below those reported for England in 2008. The percentage of frequent drinkers (4-6 days per week) has fallen for males and females between 2007 and 2009, less than half of males and a fifth of females reported for England in 2008. Respondents from the 2009 Health and Wellbeing Survey that drink less than one day per month and those that never drink were combined to get an approximation equivalent to those that drank zero days in the last week from the 2008 General Household Survey. 28\% of men from the 2009 Health and Wellbeing Survey drank zero days compared to 29\% for England, with $49 \%$ of women from the 2009 Health and Wellbeing Survey drinking zero days compared to 44\% for England.

The percentage of respondents drinking daily increases with increasing age, peaking at those aged 65-74 years (see Figure 5.13). The percentage drinking 4-6 days per week was highest in those aged 25-44 years (6.2\%), decreasing to $2.0 \%$ for those aged over 75 years. The percentage drinking 1-3 days per week was highest in those aged 18-24 years (39.5\%), decreasing with increasing age to $21.6 \%$ for those aged over 75 years. The percentage of respondents that never drink alcohol increases with increasing age, with 20.5\% of respondents aged under 65 years never drinking alcohol, compared to $40.1 \%$ of those aged over 65 years.

Figure 5.13: Frequency of alcohol consumption by age band

East locality had the highest percentage of residents who drank everyday ( $8.0 \%$ ) compared to North ( $6.4 \%$ ) and West localities (4.7\%). There was little difference between the localities in the percentage of residents drinking 4-6 days a week. West locality had the highest percentage of residents that drink $1-3$ days a week (37.6\%) in comparison to East (33.9\%) and North (33.4\%) localities. Comparing the 2007 and 2009 Health and Wellbeing Surveys by frequency of alcohol consumption (Figure 5.14), West locality sees a decrease in the percentage of residents that drink every day and 4-6 days per week between 2007 and 2009. East and North localities see a rise in the percentage of residents drinking everyday accompanied with decreases in the percentage of people drinking 4-6 days a week.

Figure 5.14: Frequency of alcohol consumption by locality, comparisons with 2007 Health and Wellbeing Survey

Figure 5.15 displays a trend with deprivation and the percentage of respondents never drinking, with $28.7 \%$ in the most deprived quintile never drinking compared to $17.2 \%$ in the least deprived quintile, possibly reflecting a choice by respondents in the most deprived quintile to spend any disposable income on cigarettes rather than alcohol (see page 47). A similar trend was found in the 2007 Hull Health and Lifestyle Alcohol Report ${ }^{14}$. There was variation between the deprivation quintiles in percentage of daily drinkers, with the middle quintile having the largest percentage of daily drinkers (9.0\%), and the second most deprived quintile the lowest (4.5\%). The percentage of respondents drinking 4-6 days a week increased overall by deprivation from $1.3 \%$ in the most deprived quintile to $6.8 \%$ in the least deprived quintile. The percentage of respondents that drank 1-3 days per week increased as deprivation decreased, from $31.6 \%$ in the most deprived quintile to $44.3 \%$ in the least deprived quintile.

Figure 5.15: Frequency of alcohol consumption by deprivation quintile

[^7]
### 5.3.2 Number of units of alcohol consumed

The median number of units consumed by those who had drunk alcohol over the previous 7 days was 10 for men and 7.6 for women. Figure 5.16 highlights the difference in alcohol consumption for all respondents between men and women, with a higher percentage of men (43.0\%) drinking more than 7 units of alcohol in the last week compared to women (20.6\%). The government guidelines on sensible drinking recommend that men should not consume more than 21 units of alcohol per week, and women no more than 14 units per week. Among all respondents $15.5 \%$ of men and $7.6 \%$ of women exceeded these guidelines. It should be noted that self reporting can under-estimate the amount of units an individual consumes ${ }^{15}$.

Figure 5.16: Level of alcohol consumption over the last 7 days for all respondents by gender

[^8]Data on consumption of alcohol in the last week for all respondents is presented in Table 5.7, alongside data from the 2007 Health and Wellbeing Survey ${ }^{16}$ and national data from the 2008 General Household Survey. The percentage of men drinking 22-50 units fell by 20\% to 12\% between 2007 and 2009, below England in 2008. The percentage of men drinking more than 50 units fell from $7 \%$ in 2007 to $4 \%$ in 2009, below England in 2008. Conversely the percentage of men drinking 1-21 units rose from $39 \%$ to $46 \%$ in 2009, with the percentage of male non drinkers remaining the same. The percentage of women drinking 15-35 units remained the same between 2007 and 2009 at 7\% (Table 5.7), below England in 2008. The percentage of women drinking more than 35 units also remained the same at 1\%, below England in 2008. The percentage of women drinking 1-14 units fell in 2009 to $33 \%$, due to a $7 \%$ increase to $59 \%$ of women not drinking alcohol.

One possible explanation for the fall in alcohol consumption could be the current economic climate, with less people willing to spend money in bars and restaurants, preferring to drink at home. Underestimation may be even greater when recalling alcohol consumption at home. The fall could also be attributed to the introduction of the smoking ban, again causing people to drink at home. It should be noted the General Household Survey includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.7: Number of units consumed for all respondents over the last 7 days by gender, comparisons with 2007 Health and Wellbeing Survey and 2008 General Household Survey ${ }^{17}$

| Gender | Number of units consumed (\%) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { None } \\ \text { (includes <1) } \end{gathered}$ | $\begin{aligned} & \text { (M: 1-21; } \\ & \text { F: 1-14) } \end{aligned}$ | $\begin{aligned} & \text { (M: 22-50; } \\ & \text { F: 15-35) } \end{aligned}$ | $\begin{gathered} \text { (M: } 51+; \\ \text { F: } 36+\text { ) } \end{gathered}$ |
| Males |  |  |  |  |
| Hull 2007 | 39 | 39 | 15 | 7 |
| Hull 2009 | 39 | 46 | 12 | 4 |
| England 2008 | 19 | 53 | 20 | 7 |
| Females |  |  |  |  |
| Hull 2007 | 55 | 37 | 7 | 1 |
| Hull 2009 | 59 | 33 | 7 | 1 |
| England 2008 | 33 | 47 | 15 | 5 |

[^9]Figure 5.17 displays the percentage of all respondents exceeding the recommended weekly alcohol limits, with data from the 2003 and 2007 Health and Wellbeing Surveys. There is variation between the surveys in the percentage of men exceeding the recommended 21 units of alcohol per week and results should be interpreted with caution due to different sample sizes. Positively the survey with the lowest percentage of men drinking over the recommended weekly guidelines was found in 2009 (15.5\%), followed by 2003 (17.1\%) and 2007 ( $21.7 \%$ ). There is less variation across the surveys for women, with the lowest percentage of women drinking over the recommended guidelines found in 2003 (6.7\%), followed by 2009 (7.6\%) and 2007 (8.4\%). The percentage of men exceeding the recommended weekly guidelines is consistently higher than women across all three surveys.

Figure 5.17: Percentage of all respondents exceeding recommended alcohol consumption (21 units men; 14 units women) over last 7 days by survey and gender

The percentage of men that drink 22-50 units and women that drink 15-35 units over the last 7 days decreases with increasing age. The percentage of men aged under 65 years that drink 22-50 units was $13.8 \%$ compared to $0.7 \%$ of men aged over 65 years, with $4.3 \%$ of men aged under 65 years drinking over 50 units compared to $0.7 \%$ of men aged over 65 years. Among women, $7.8 \%$ aged under 65 years drink 15-35 units compared to $1.7 \%$ of women aged over 65 years, with $1.3 \%$ drinking over 35 units compared to $0 \%$ for women aged over 65 years.

The percentage of all respondents exceeding the recommended weekly guidelines decreases with increasing age (see Figure 5.18), with no men or women aged over 75 years exceeding the recommended weekly guidelines. The percentage of men aged under 65 years drinking alcohol above the recommended weekly guidelines was $18.1 \%$, compared with $9.1 \%$ of females. However, for ages 65-74 years, $3.4 \%$ of women drank over the recommended weekly guidelines, compared to $2.5 \%$ of men.

Figure 5.18: Percentage of all respondents exceeding recommended alcohol consumption (21 units men; 14 units women) over last 7 days by gender and age band

There is little difference by locality in the amount of units consumed by all respondents in the last 7 days, West locality had the highest percentage of men drinking 22-50 units and women 15-35 units (10.4\%). East locality had the highest percentage of men drinking over 50 units and women over 35 units (2.7\%), with North locality having the highest percentage of non drinkers (50.8\%). West locality had the highest percentage of men drinking over the recommended weekly guidelines (16.8\%) in comparison to East (13.1\%) and North (13.0\%) localities. This is repeated for females, with $8.7 \%$ of women in West locality drinking over the recommended weekly guidelines compared to $7.5 \%$ in North locality and $6.3 \%$ in East locality. West locality has a large student population, which may explain the higher percentage of residents drinking over the recommended weekly guidelines. West locality residents also have better access to bars and restaurants compared with North and East localities.

Looking at unit consumption in the last 7 days for all respondents by deprivation quintile (Figure 5.19), the percentage of men drinking 22-50 units was highest in the least deprived quintile (13.9\%), and lowest in the second most deprived quintile ( $8.3 \%$ ). The percentage of men drinking over 50 units in the two most deprived quintiles combined was $4.5 \%$, compared to $2.3 \%$ in the two least deprived quintiles combined. The highest percentage of women drinking 15-35 units was in the middle quintile (9.8\%), compared to the lowest percentage in the most deprived quintile (3.5\%). The percentage of women drinking over 35 units was highest in the least deprived quintile ( $2.5 \%$ ), with the remaining quintiles ranging from $0.7 \%$ to $0.8 \%$. Combining the two most deprived quintiles, $9.9 \%$ of respondents drank over the recommended weekly guidelines in the last week ( 21 units men; 14 units women) compared to $12.5 \%$ of the remaining quintiles combined.

Figure 5.19: Alcohol consumption over the last 7 days for all respondents by gender and deprivation quintile

Figure 5.20 compares alcohol consumption by deprivation quintile between the 2007 and 2009 Health and Wellbeing Surveys. Each quintile in 2007 had a higher percentage of respondents exceeding the recommended weekly alcohol consumption level compared with 2009. The two surveys follow a similar trend by deprivation quintile, with the exception of the second most deprived quintile, which had double the percentage of respondents exceeding the weekly guidelines in 2007 compared with 2009.

Figure 5.20: Percentage of all respondents exceeding recommended alcohol consumption (21 units men; 14 units women) over last 7 days by deprivation, comparisons with 2007 Health and Wellbeing Survey

The results of the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{18}$ (which included questions on risk factors amongst other questions) are combined (see Table 5.8) in order to give a greater degree of precision due to the larger sample size, with a total of 5,757 respondents. This process means that the 2009 surveys can be reliably compared both with the results from the 2007 Health and Wellbeing Survey as well as with the most recent Health Survey for England. The percentage of men drinking more than 21 units of alcohol per week decreased in 2009, while the percentage of women drinking more than 14 units of alcohol per week increased. Percentages remained lower than for England among both men (32\% lower) and women (42\% lower).

Table 5.8: Percentage of all respondents exceeding recommended alcohol consumption (21 units men; 14 units women) over last 7 days from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 General Household Survey ${ }^{19}$, adjusted for age

| Survey | Age-adjusted percentages |  |  |
| :--- | :---: | :---: | :---: |
|  | Men | Women | All |
| Hull 2007 | $22 \%$ | $9 \%$ | $15 \%$ |
| Hull 2009 | $19 \%$ | $11 \%$ | $15 \%$ |
| England 2008 | $28 \%$ | $19 \%$ | $23 \%$ |

[^10]
### 5.3.3 Binge drinking

Binge drinking is defined as the consumption on a single day of 8 or more units of alcohol by men, or 6 or more units of alcohol in women, twice the recommended daily limits (2-3 units for women; 3-4 units for men). This section analyses $75.8 \%$ of survey respondents that both drink alcohol and provided answers to the binge drinking questions (questions 8a for men and 8 b for women). $26.1 \%$ of respondents that drink alcohol were classified as binge drinking on at least 1 day per week $33.4 \%$ of men and $17.4 \%$ of women). Only $32.3 \%$ of drinkers ( $27.6 \%$ of men and $38.0 \%$ of women) reported they never binge drink.

Young male respondents (aged 18-24 years) who drink have the highest proportion of binge drinkers (see Figure 5.21), with $42.2 \%$ binge drinking on at least one day a week ( $2.6 \%$ everyday). The percentage of drinkers that binge drink at least one day a week decreased with increasing age to $13.5 \%$ of men aged over 75 years, with $75.7 \%$ of men aged over 75 years never binge drinking. The majority of male binge drinkers do so 1-3 days a week. Females aged 18-24 years who drink have the highest proportion of binge drinkers (see Figure 5.21), with $24.8 \%$ binge drinking on at least one day a week (0.0\% everyday). The percentage of women drinkers that binge drink at least one day a week decreased with increasing age to $2.4 \%$ of women aged over 75 years, with $85.4 \%$ of women aged over 75 years never binge drinking. In contrast to men, the majority of women who binge drink do so less than once a month.

Figure 5.21: Percentage of regular (at least one day per week) binge drinkers (males exceeding 8 units, females exceeding 6 units, of alcohol in a single day) by age band and gender

East locality had the highest percentage of frequent male binge drinkers, with $35.0 \%$ of men binge drinking at least once a week (including $4.1 \%$ on a daily basis) compared to $33.6 \%$ and $30.4 \%$ in West and North localities respectively. North locality had the highest percentage of frequent female binge drinkers, with $20.0 \%$ of women binge drinking at least once a week (including $0.7 \%$ on a daily basis) compared to $17.4 \%$ and $16.0 \%$ in East and West localities respectively. The percentage of men binge drinking at least once a week by Area Committee Area ranged from 25.9\% in Northern Area Committee Area, to $38.5 \%$ in Riverside (West) Area Committee Area, and ranged from $8.1 \%$ in West Area Committee Area, to 25.0\% in Riverside (East) Area Committee Area for women.

There is variation across deprivation quintiles in the percentage of respondents who binge drink on at least one day per week (see Figure 5.22). Males in the most deprived quintile had the highest percentage of binge drinkers (40.9\%), with the second most deprived quintile the lowest ( $26.9 \%$ ). Females in the second most deprived quintile had the highest percentage of binge drinkers ( $20.9 \%$ ), with the middle quintile the lowest ( $12.5 \%$ ). Combining the two most deprived quintiles, $5.0 \%$ of men binge drink every day compared to $2.1 \%$ in the two least deprived quintiles, with $1.0 \%$ of women from the two most deprived quintiles binge drinking every day compared to $0.0 \%$ in the two least deprived quintiles. Interestingly respondents from the most deprived quintiles are more likely to never drink, but when they do drink are more likely to binge drink.

Figure 5.22: Percentage of regular (at least one day per week) binge drinkers (males exceeding 8 units, females exceeding 6 units, of alcohol in a single day) by deprivation quintile

Table 5.9 combines those who drink more than the recommended weekly amount with those that regularly binge drink (at least once a week). Numbers and percentages here will differ from those above, as not everybody who answered the question on binge drinking answered the question on number of alcoholic drinks. A larger percentage of men drink above the recommended weekly limits and binge drink (14\%) compared to women (7\%). A larger percentage of men drink within the recommended weekly limits and binge drink (19\%) compared to women (11\%).

A lower percentage of respondents drink beyond the recommended weekly guidelines (19\% of men and 11\% of women) compared to England (34\% of men and $29 \%$ of women). A higher percentage of men binge drink (33\%) compared to England (26\%), with the percentage of men in Hull binge drinking but staying within the recommended weekly guidelines double the percentage for England. The percentage of women binge drinking was lower (18\%) compared with England (22\%), although the percentage drinking within the recommended weekly limits and binge drinking was higher (11\%) compared to England (9\%). It should be noted the General Household Survey includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.9: Percentage binge drinking (8+ units men, 6+ units women) at least one day per week or drinking above weekly recommended limits (21 units men, 14 units women) by age and gender comparisons with 2008 General Household Survey ${ }^{20}$

| Gender | Binge drinking and weekly guidelines (\%) |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Within weekly guidelines | Above weekly guidelines |  |  |  |  |  |
|  | Binge drinking |  |  |  |  | Binge drinking |  |
|  | Yes | No | Yes | No |  |  |  |
| Males |  |  |  |  |  |  |  |
| Hull 2009 | 19 | 62 | 14 | 5 |  |  |  |
| England 2008 | 9 | 57 | 17 | 17 |  |  |  |
| Females |  |  |  |  |  |  |  |
| Hull 2009 | 11 | 78 | 7 | 4 |  |  |  |
| England 2008 | 9 | 63 | 13 | 16 |  |  |  |

Figure 5.23 shows men aged $18-24$ years had the highest percentage of binge drinkers exceeding the recommended weekly limit (22.4\%), decreasing with increasing age to $0 \%$ for men aged over 64 years. The percentage of men who were binge drinkers but kept within the weekly limit was highest in those aged 45-64 years (22.2\%). The percentage of male drinkers that did not binge drink and were within the weekly limit increased with age from $53.4 \%$ in those aged $18-24$ years to $86.5 \%$ in those aged over 75 years.

Similar trends in women binge drinkers was seen (see Figure 5.23), with women aged 18-24 years having the highest percentage of respondents who binge drink and exceed the recommended weekly limits (11.4\%), with no women aged over 64 years falling into the same category. The percentage of women drinkers that did not binge drink and were within the weekly limit ranged from $71.4 \%$ in those aged between 18-24 years, to $97.6 \%$ in those aged over 75 years.

Figure 5.23: Percentage binge drinking (8+ units men, 6+ units women) at least one day per week or drinking above weekly recommended limits (21 units men, 14 units women) by age and gender

By residence (see Figure 5.24), West locality had the highest percentage of men who binge drink and exceed recommended weekly limits (16.6\%), with East locality having the highest percentage of men that binge drink within the recommended weekly limits (21.8\%). Among women, North and West localities had the highest percentage of binge drinkers exceeding recommended weekly limits (7.4\%), with North locality having the highest percentage of women that binge drink within the recommended weekly limits (12.6\%).

Figure 5.24: Percentage binge drinking (8+ units men, 6+ units women) at least one day per week or drinking above weekly recommended limits (21 units men, 14 units women) by locality of residence and gender

There was variation across deprivation quintiles in the percentage of respondents binge drinking and exceeding the recommended weekly limits (see Figure 5.25). The percentage of men both binge drinking and exceeding the weekly limit was highest in the second least deprived quintile (16.3\%) and lowest in the least deprived quintile (10.0\%). The percentage of men who binge drink within the recommended weekly limit was highest in the most deprived quintile (28.3\%) and lowest in the second most deprived quintile (13.4\%). For women the percentage both binge drinking and exceeding the weekly limit was highest in the second most deprived quintile (8.2\%) and lowest in the most deprived quintile (3.3\%). The percentage of women who drink within the recommended weekly limits and binge drink was highest in the most deprived quintile (15.2\%) and lowest in the middle quintile (7.7\%).

Figure 5.25: Percentage binge drinking (8+ units men, 6+ units women) at least one day per week or drinking above weekly recommended limits (21 units men, 14 units women) by deprivation quintile

The age-adjusted percentages of binge drinkers from the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{21}$ combined are presented in Table 5.10. The percentages of adults that were binge drinking decreased slightly since 2007 in both men and women. Percentages in Hull in 2009 were 12\% higher than England among men and 20\% lower among women.

Table 5.10: Percentage binge drinking (8+ units men, 6+ units women) at least one day per week from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 General Household Survey ${ }^{22}$, adjusted for age

| Survey | Age-adjusted percentages |  |  |
| :--- | :---: | :---: | :---: |
|  | Men | Women | All |
| Hull 2007 | $29 \%$ | $14 \%$ | $21 \%$ |
| Hull 2009 | $27 \%$ | $12 \%$ | $19 \%$ |
| England 2008 | $24 \%$ | $15 \%$ | $20 \%$ |

Tables of data relating to alcohol consumption, the frequency and amount, binge drinking and type of alcohol consumed broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 8 on page 84.

[^11]
### 5.4 Smoking

### 5.4.1 Smoking prevalence

Smoking prevalence among survey respondents was $35.1 \%$, higher among men ( $38.1 \%$ ) than women (32.2\%). The 2008 Health Survey for England ${ }^{23}$ reports smoking prevalence at $24 \%$ for men and $20 \%$ for women. It should be noted the Health Survey for England includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly. Figure 5.26 shows men aged 25-44 years had the highest percentage of daily smokers (41.8\%), with those aged 65-74 years the lowest (12.7\%). Among women ages 25-44 years also had the highest percentage of daily smokers (37.8\%), with those aged over 75 years the lowest (13.3\%). Smoking patterns by age were broadly similar for men and women, however the percentage of those that have never smoked is largest among women aged over 45 years, possibly reflecting the different historical smoking patterns for men and women, when fewer women than men smoked.

Figure 5.26: Smoking habits by age and gender

[^12]Figure 5.27 maps smoking prevalence by ward across Hull for males and females combined. East locality had the highest percentage of residents who smoke (38.0\%), whilst North locality had the lowest (32.4\%). North locality also had the highest percentage of residents that had never smoked ( $42.3 \%$ ). Smoking prevalence by Area Committee Area ranged from 47.3\% in Riverside (West) Area Committee Area, to 26.3\% in West Area Committee Area.

Figure 5.27: Smoking prevalence by ward

Over half of respondents in the most deprived quintile smoked (53.7\%), decreasing with decreasing deprivation to $20.1 \%$ in the least deprived quintile (Figure 5.28), indicating a relationship between deprivation and smoking prevalence. The least deprived quintile was the only quintile in which a majority had never smoked (55.7\%).

Figure 5.28: Smoking status by deprivation quintile

Table 5.11 compares smoking prevalence in the 2009 Health and Wellbeing Survey against previous surveys conducted in Hull, and latest national data from the 2008 Health Survey for England. The 2003 Health and Wellbeing Survey and 2004 Social Capital Survey are combined because the prevalence rates derived from these two surveys were very different, and it is not clear which estimate is the most reliable, so a weighted average is presented, and will be used for comparisons with the 2009 Health and Wellbeing Survey data. The smoking prevalence for men increased between 2007 and 2009 by 12\%, with the highest increase seen in those aged 45-54 years (33\%). Decreases were seen in those aged 18-24 years (5\%) and 65-74 years (43\%). Smoking prevalence decreased by $7 \%$ between 2003/2004 and 2009, with the largest decrease (21\%) seen in ages 18-24 years.

Smoking prevalence among men in 2009 was $58 \%$ higher compared with England in 2008, higher in each age band with the exception of those aged 6574 years. Differences ranged from $38 \%$ higher in men aged $25-34$ years to over three times higher for ages over 75 years. Although smoking prevalence is significantly higher in Hull compared to England, these numbers could underestimate the differences as the England survey took place one year earlier, and smoking rates may have fallen since 2008. The Health Survey for England also includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

The smoking prevalence among women increased by 7\% between 2007 and 2009, increases ranged from $3 \%$ in those aged $45-54$ years to $21 \%$ in those aged 55-64 years. Those aged 18-24 years and 65-74 years saw decreases of $6 \%$ and $32 \%$ respectively. Between 2003/2004 and 2009 there was an $11 \%$ decrease in smoking prevalence, with the highest decrease seen in those aged $18-24$ years (35\%). Smoking prevalence among women in 2009 was $60 \%$ higher than for England in 2008, differences ranging from 15\% higher in those aged 65-74 years to over double for those aged 55-64 years (although with the same caveats outlined earlier).

Table 5.11: Smoking prevalence by gender and age, comparisons with weighted average 2003 Health and Wellbeing Survey/2004 social capital survey, 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{24}$

| Age <br> (years) | Smoking prevalence (\%) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Weighted <br> average <br> 2003, 2004 | $\mathbf{2 0 0 7}$ | $\mathbf{2 0 0 9}$ | 2008 |  |
|  |  |  |  |  |  |
| $18-24$ | 52 | 43 | 41 | 28 |  |
| $25-34$ | 46 | 38 | 47 | 34 |  |
| $35-44$ | 43 | 39 | 43 | 30 |  |
| $45-54$ | 46 | 33 | 44 | 22 |  |
| $55-64$ | 38 | 29 | 35 | 18 |  |
| $65-74$ | 32 | 23 | 13 | 13 |  |
| $75+$ | 21 | 18 | 19 | 6 |  |
| All | 41 | 34 | 38 | 24 |  |
| Females |  |  |  |  |  |
| $18-24$ | 49 | 34 | 32 | 25 |  |
| $25-34$ | 39 | 37 | 43 | 25 |  |
| $35-44$ | 37 | 34 | 39 | 25 |  |
| $45-54$ | 39 | 32 | 33 | 20 |  |
| $55-64$ | 35 | 29 | 35 | 16 |  |
| $65-74$ | 22 | 22 | 15 | 13 |  |
| $75+$ | 21 | 13 | 14 | 8 |  |
| All | 36 | 30 | 32 | 20 |  |

[^13]There was an $11 \%$ increase (from $31.7 \%$ to $35.1 \%$ ) in smoking prevalence between 2007 and 2009. Looking at this increase by deprivation (see Figure 5.29), increases are seen in the most deprived quintile (13\%) and middle quintile $(20 \%)$, with the remaining quintiles decreasing between $1 \%$ and $4 \%$. Between 2003/04 and 2007 smoking prevalence remained virtually the same in the most deprived quintile, increased in the second most deprived quintile by $7 \%$, with the remaining quintiles all seeing decreases of between $23 \%$ and $29 \%$.

Comparing 2003/04 and 2009 the most deprived and second most deprived quintiles saw an increase of $13 \%$ and $6 \%$ respectively in the prevalence of smokers. The remaining quintiles all saw decreases, with the second least deprived and least deprived quintiles seeing decreases of $32 \%$ and $27 \%$ respectively. As reported in the 2007 Health and Wellbeing Survey ${ }^{25}$ this would suggest that smoking cessation services and health education messages are not reaching these groups. It may be that a greater segmentation of the Hull population is required in order to target and influence these hard to reach groups.

Figure 5.29: Smoking prevalence by deprivation, comparisons with 2003 weighted average Health and Wellbeing Survey/2004 social capital survey and 2007 Health and Wellbeing Survey

All estimates within this survey are subject to random variation, with different groups of people being surveyed. Therefore, even though rates appear to have increased marginally between 2007 and 2009 this does not necessarily mean that the true underlying trend in the overall Hull population has increased. A slightly different group of people may have been asked if they smoked in 2009, which by chance have a larger proportion of smokers.

[^14]The results of the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{26}$ (which included questions on risk factors amongst other questions) are combined (see Table 5.12) in order to give a greater degree of precision due to the larger sample size, with a total of 5,757 respondents. This process means that the 2009 surveys can be reliably compared both with the results from the 2007 Health and Wellbeing Survey as well as with the most recent Health Survey for England. The percentage of adults in Hull who smoke increased slightly in women, remaining unchanged in men. Smoking rates in Hull in 2009 were 43\% higher than England among men and 68\% higher among women.

Table 5.12: Smoking prevalence from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{27}$, adjusted for age

| Survey | Age-adjusted percentages |  |  |
| :--- | :---: | :---: | :---: |
|  | Men | Women | All |
| Hull 2007 | $33 \%$ | $29 \%$ | $31 \%$ |
| Hull 2009 | $33 \%$ | $32 \%$ | $33 \%$ |
| England 2008 | $23 \%$ | $19 \%$ | $21 \%$ |

[^15]
### 5.4.2 Heavy smokers

Of those survey respondents who smoked cigarettes, $31.2 \%$ were heavy smokers, smoking on average at least 20 cigarettes per day. A higher percentage of men (35.9\%) were heavy smokers compared to women (26.9\%). Those aged 45-64 years had the highest percentage of heavy smokers, $51.4 \%$ of men and $30.5 \%$ of women (see Figure 5.30). No heavy smokers were found in men aged over 75 years, whilst women aged over 75 years had the lowest percentage of heavy smokers (16.7\%).

Figure 5.30: Percentage of heavy smokers amongst cigarette smokers by gender and age

West locality had the highest percentage of residents who were heavy smokers (32.7\%), compared with East (30.4\%) and North (29.9\%) localities. At Area Committee Area the percentage of heavy smokers ranged from $13.0 \%$ in Riverside (East) to $40.2 \%$ in Riverside (West). Figure 5.31 displays heavy cigarette smoking by deprivation quintile, highlighting a trend between heavy smoking and deprivation, with the percentage of heavy smokers decreasing with decreasing deprivation (with the exception of the least deprived quintile). A higher percentage of heavy cigarette smokers were found in the two most deprived quintiles combined (36.5\%), compared to the two least deprived quintiles combined (23.2\%).

Figure 5.31: Percentage of heavy smokers amongst cigarette smokers by deprivation quintile

Table 5.13 compares the average number of cigarettes smoked per day (percentage of all cigarette smokers) in the 2009 Hull Health and Wellbeing Survey against the 2007 Hull Health and Wellbeing Survey and 2008 Health Survey for England. The Health Survey for England includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.13: Average number of cigarettes smoked per day, (percentage of all cigarette smokers) by gender and age, comparisons with 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{28}$

|  | Average number of cigarettes smoked per day (\%) |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Light (1-9) | Medium (10-19) | Heavy (20+) |  |
| Males | 26 | 39 | 35 |  |
| 2007 Hull | 22 | 42 | 36 |  |
| 2009 Hull | 31 | 40 | 29 |  |
| 2008 England |  |  |  |  |
| Females |  |  |  |  |
| 2007 Hull | 23 | 45 | 32 |  |
| 2009 Hull | 26 | 47 | 27 |  |
| 2008 England | 36 | 43 | 21 |  |

The percentage of men smoking 20 or more cigarettes per day on average increased between 2007 and 2009 by $3 \%$ to $36 \%$, above England in 2008 (29\%). The percentage of men smoking fewer than 10 a day decreased by $15 \%$ to 22\% between 2007 and 2009, below England in 2008 (31\%). The percentage of women who smoked 20 or more cigarettes per day decreased by $16 \%$ to 27\% between 2007 and 2009, above England in 2008 (21\%). The percentage of women smoking less than 10 a day increased by $13 \%$ to $26 \%$ between 2007 and 2009, but still below England in 2008 (36\%).

Tables of data relating to smoking prevalence, current smoking habits and consumption broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 9 on page 107.

### 5.5 Exercise

Based on the national recommendation of exercising moderately or vigorously for at least 30 minutes on at least 5 occasions per week, under a third of survey respondents undertook sufficient exercise (30.8\%). Figure 5.32 displays the percentage of respondents taking various levels of exercise, by subgroup. A larger percentage of men exercised to national recommended levels (35.7\%) compared to women ( $25.8 \%$ ), with a larger percentage of women exercising lightly ( $39.8 \%$ ) compared to men ( $29.6 \%$ ). $7.6 \%$ of men and $6.2 \%$ of women never exercised. Those aged 18-24 years had the highest percentage of respondents undertaking sufficient exercise (37.2\%); decreasing with increasing age to $6.8 \%$ in those aged over 75 years. The percentage of respondents never exercising ranged from $3.3 \%$ to $7.9 \%$ in those aged under 75 years, with $23.0 \%$ of those aged over 75 years never exercising.

West locality had the highest percentage of residents that exercised to national recommendations (34.9\%) compared to East (28.6\%) and North (26.5\%) localities. East locality had the highest percentage of residents that never exercised ( $8.5 \%$ ) compared to the lowest percentage in West locality (5.5\%). The higher levels of exercise in West locality may be due to the high student population and/or more opportunities to exercise because of city centre location. By deprivation, combining the two least deprived quintiles, $31.6 \%$ of respondents undertook sufficient exercise compared to $28.9 \%$ in the two most deprived quintiles combined. $9.7 \%$ in the two most deprived quintiles never exercised compared to $4.8 \%$ in the two least deprived quintiles combined.

Figure 5.32: Percentage taking moderate or vigorous exercise of at least 30 minutes duration, by subgroup

Table 5.14 displays percentage of respondents undertaking sufficient exercise (based on national recommended guidelines) by age and gender, with the 2007 Health and Wellbeing Survey and national data from the 2008 Health Survey for England. A lower percentage of men in 2009 undertook sufficient exercise (36\%) compared to England in 2008 (39\%). All age bands for England had higher exercise levels with the exception of those aged 65-74 years (35\% higher compared to England, with an absolute difference of 7\%). Men aged 1824 years undertaking sufficient exercise was 19\% lower than England, an absolute difference of $10 \%$.

A lower percentage of women in 2009 undertook sufficient exercise ( $26 \%$ ) compared to England in 2008 (29\%). The majority of age bands for England had higher exercise levels in women, with the exception of ages 45-54 years and over 75 years (absolute differences of $4 \%$ and $2 \%$ respectively). Women aged 35-44 years undertaking sufficient exercise levels was $26 \%$, lower than England, with an absolute difference of 9\%. The Health Survey for England includes those aged 16-17 years in their youngest age group, which can bias comparisons slightly.

Table 5.14: Percentage taking moderate or vigorous exercise of at least 30 minutes duration on at least 5 occasions per week by gender and age, comparisons with Health Survey for England $2008^{29}$

| Gender | Percentage taking moderate or vigorous exercise lasting at least 30 minutes on at least 5 days per week |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Age band |  |  |  |  |  |  | Total |
|  | 18-24 | 25-34 | 35-44 | 45-54 | 55-64 | 65-74 | 75+ |  |
| Males |  |  |  |  |  |  |  |  |
| England 2008 | 53 | 49 | 44 | 41 | 32 | 20 | 9 | 39 |
| Hull 2007 | 47 | 41 | 35 | 23 | 17 | 12 | 5 | 29 |
| Hull 2009 | 43 | 42 | 43 | 37 | 28 | 27 | 5 | 36 |
| Females |  |  |  |  |  |  |  |  |
| England 2008 | 35 | 36 | 34 | 32 | 28 | 17 | 6 | 29 |
| Hull 2007 | 32 | 35 | 30 | 24 | 17 | 11 | 7 | 24 |
| Hull 2009 | 31 | 35 | 25 | 36 | 22 | 11 | 8 | 26 |

[^16]There has been a 24\% increase between 2007 and 2009 in the percentage of men undertaking sufficient exercise. All age bands saw an increase between 2007 and 2009, with the exception of those aged 18-24 years, which saw a $9 \%$ decreases to $43 \%$. The largest increases seen in 45-74 year olds. Among women there was an $8 \%$ increase between 2007 and 2009 in the percentage undertaking sufficient exercise. Those aged under 45 years saw a decrease, whilst ages 45-54 years saw a $50 \%$ increase. Different methods of measurement for exercise levels were used in the 2007 and 2009 Hull surveys which may affect numbers and bias comparisons slightly.
The results of the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{30}$ (which included questions on risk factors amongst other questions) are combined (see Table 5.15) in order to give a greater degree of precision due to the larger sample size, with a total of 5,757 respondents. This process means that the 2009 surveys can be reliably compared both with the results from the 2007 Health and Wellbeing Survey as well as with the most recent Health Survey for England. The percentage of men and women in Hull achieving the amount of exercise recommended for good health ( 30 minutes of moderate or vigorous exercise at least 5 times per week) increased in both men and women, but remained about 10\% below the all-England percentages.

Table 5.15: Percentage taking moderate or vigorous exercise of at least 30 minutes duration on at least 5 occasions per week from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{31}$, adjusted for age

| Survey | Age-adjusted percentages |  |  |
| :--- | :---: | :---: | :---: |
|  | Men | Women | All |
| Hull 2007 | $28 \%$ | $23 \%$ | $26 \%$ |
| Hull 2009 | $35 \%$ | $25 \%$ | $30 \%$ |
| England 2008 | $39 \%$ | $28 \%$ | $33 \%$ |

[^17]
### 5.6 Obesity

Respondents are categorised into underweight, healthy weight, overweight and obese by their body mass index (BMI). The BMI of each respondent has been adjusted to take into account the under-estimation of weight and overestimation of height (see page 9). Overall $63.3 \%$ of survey respondents were overweight or obese, a larger percentage of men ( $67.0 \%$ ) compared to women (59.5\%). A similar percentage of men (24.2\%) and women (24.6\%) were obese, whilst $6.7 \%$ of women were underweight, compared to $2.4 \%$ of men (see Figure 5.33). Looking at the difference between men and women in proportion overweight, it is interesting that a higher proportion of women eat a healthy diet and a higher proportion of men exercise to sufficient levels, but a lower proportion of women are overweight.

Figure 5.33: Adjusted BMI category by gender

Those aged $45-64$ years and 65-74 years had the highest percentage of overweight or obese respondents ( $74.3 \%$ and $74.4 \%$ respectively), with the highest percentage of obese respondents in those aged 45-64 years and 6574 years ( $31.8 \%$ and $32.1 \%$ respectively). Around half of those aged $18-24$ years (50.4\%) were a healthy weight, with $9.3 \%$ underweight (see Figure 5.34).

Figure 5.34: Adjusted BMI category by age band

The percentage of respondents overweight or obese was highest in East locality ( $64.8 \%$ ), compared with North (64.2) and West (61.6\%) localities. The percentage obese varied a little more by locality, with East locality having the highest percentage of obese residents (27.9\%), compared with North (26.0\%) and West (20.5\%) localities. North Carr Area Committee Area had the highest percentage of overweight or obese residents (69.6\%), with the highest mean adjusted BMI (27.8). Wyke Area Committee Area had the highest percentage of residents with a healthy weight (42.4\%) and highest percentage underweight (6.9\%), with the lowest mean adjusted BMI (25.7).

The larger student (consequently younger) population may explain West locality having a low proportion of overweight or obese residents. Another possible explanation is East and West localities are more remote in terms of access to sports facilities, providing a barrier to exercise because of travel. The percentage of overweight or obese respondents by ward is presented in Figure 5.35. Interestingly Kings Park and Beverley have high percentages of overweight or obese residents even though they are slightly more affluent areas and have a relatively young population compared to other wards within Hull.

Figure 5.35: Percentage of respondents overweight or obese by ward

Overweight and obesity varied across deprivation quintiles (see Figure 5.36), with the highest percentage of overweight or obese respondents in the second most deprived quintile ( $69.8 \%$ ), the lowest in the middle quintile ( $57.8 \%$ ), and $66.8 \%$ in the least deprived quintile. The highest percentage of obese respondents were in the second most deprived quintile ( $27.9 \%$ ), with the lowest percentage in the least deprived quintile ( $19.5 \%$ ). Combining the two most deprived quintiles, $27.2 \%$ of respondents were obese compared to $21.3 \%$ in the two least deprived quintiles combined.

Figure 5.36: Adjusted BMI category by deprivation quintile

Table 5.16 presents data on the percentage of overweight or obese respondents from the 2007 and 2009 Health and Wellbeing Surveys and 2008 Health Survey for England. It should be noted that given the rising levels of overweight and obesity in England, the comparisons between England 2008 and Hull 2009 could be biased, as the 2008 data is likely to underestimate the 2009 levels of overweight or obesity. The Health Survey for England also includes those aged 16-17 years in their youngest age group, which can also bias comparisons slightly.

Table 5.16: Prevalence of overweight and obese adults by gender and age, comparison with 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{32}$

| Gender | Overweight or obese (\%) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Age band |  |  |  |  |  |  | Total |
|  | 18-24 | 25-34 | 35-44 | 45-54 | 55-64 | 65-74 | 75+ |  |
| Overweight |  |  |  |  |  |  |  |  |
| Males |  |  |  |  |  |  |  |  |
| England 2008 | 25.0 | 40.6 | 46.5 | 43.7 | 44.3 | 49.9 | 49.4 | 41.8 |
| Hull 2007 | 37.5 | 46.4 | 50.3 | 49.8 | 52.7 | 52.5 | 55.3 | 48.6 |
| Hull 2009 | 34.1 | 40.9 | 44.4 | 46.9 | 43.4 | 44.7 | 48.3 | 42.8 |
| Females |  |  |  |  |  |  |  |  |
| England 2008 | 20.3 | 26.5 | 31.2 | 35.1 | 37.7 | 38.5 | 39.8 | 32.0 |
| Hull 2007 | 20.1 | 26.5 | 29.3 | 37.2 | 36.8 | 41.5 | 41.7 | 32.7 |
| Hull 2009 | 23.3 | 32.6 | 34.3 | 44.8 | 33.3 | 40.0 | 37.6 | 34.8 |
| Obese |  |  |  |  |  |  |  |  |
| Males |  |  |  |  |  |  |  |  |
| England 2008 | 7.8 | 17.6 | 26.1 | 30.8 | 33.9 | 33.0 | 22.7 | 24.1 |
| Hull 2007 | 8.4 | 13.4 | 18.1 | 25.6 | 26.6 | 25.1 | 12.9 | 18.3 |
| Hull 2009 | 9.8 | 19.5 | 26.9 | 33.1 | 32.8 | 28.9 | 15.5 | 24.2 |

| England 2008 | 13.9 | 18.8 | 25.2 | 28.9 | 31.0 | 33.3 | 25.8 | 24.9 |
| Hull 2007 | 14.8 | 25.5 | 29.7 | 34.0 | 28.4 | 16.7 | 23.2 | 23.1 |
| Hull 2009 | 12.9 | 25.0 | 25.0 | 32.8 | 28.1 | 35.0 | 12.9 | 24.6 |
| Overweight or obese |  |  |  |  |  |  |  |  |
| Males |  |  |  |  |  |  |  |  |
| England 2008 | 32.8 | 58.2 | 72.6 | 74.5 | 78.3 | 82.9 | 72.1 | 65.9 |
| Hull 2007 | 46.0 | 59.8 | 68.4 | 75.5 | 79.3 | 77.6 | 68.2 | 66.9 |
| Hull 2009 | 43.9 | 60.4 | 71.3 | 80.0 | 76.2 | 73.7 | 63.8 | 67.0 |
| Females |  |  |  |  |  |  |  |  |
| England 2008 | 34.2 | 45.3 | 56.4 | 64.0 | 68.6 | 71.8 | 65.7 | 56.9 |
| Hull 2007 | 41.3 | 54.8 | 66.9 | 70.8 | 69.9 | 58.3 | 55.8 | 55.8 |
| Hull 2009 | 36.2 | 57.6 | 59.3 | 77.6 | 61.4 | 75.0 | 50.6 | 59.5 |

The percentage of men that are overweight or obese has stayed virtually the same between 2007 and 2009 ( $66.9 \%$ and $67.0 \%$ respectively), but above England in 2008 ( $65.9 \%$ ). The percentage of overweight or obese males aged 18-24 years decreased between 2007 and 2009 to $43.9 \%$, but still higher than England in 2008 (32.8\%). All men aged over 54 years saw a decrease between 2007 and 2009, the largest decrease in those aged over 75 years, falling by 6\% to 63.8\%, below England in 2008 (72.1\%).

Among women the overall percentage overweight or obese saw an increase of 7\% to 59.5\% between 2007 and 2009, higher than England in 2008 (56.9\%). The percentage of overweight or obese women age 18-24 years saw the largest decrease between 2007 and 2009, falling by $12 \%$ to $36.2 \%$, but still above England in 2008 (34.2\%). The largest increase was seen in women aged 6574 years, rising by 29\% to 75.0\%, again above England in 2008 (71.8\%).

The percentage of obese men in 2009 was $24.2 \%$, an increase of $32 \%$ on 2007, but virtually the same as England in 2008. There was an increase across all age bands between 2007 and 2009, the largest increase in those aged 35-44 years (an increase of 49\%). All men aged between 18-54 years had a higher percentage obese compared to England in 2008, the largest difference in ages $18-24$ years ( $26 \%$ higher compared to England). All men aged over 54 years had a lower percentage obese compared to England in 2008, the largest difference in ages over 75 years ( $32 \%$ lower compared to England).

The percentage of obese women in 2009 was $24.6 \%$, an increase of $6 \%$ between 2007 and 2009, marginally lower than England in 2008 (24.9\%). The only increase seen in women between 2007 and 2009 was in those aged 6574 years, which more than doubled from $16.7 \%$ in 2007 to $35.0 \%$ in 2009, higher than England in 2008 (33.3\%). The remaining age bands all saw a decrease in the percentage of women obese, the largest decrease in those aged over 75 years (44\%). Women aged $25-34$ years, $45-54$ years and 65-74 years had a higher percentage of obese women compared to England in 2009, the largest difference in ages 25-34 years (33\% higher than England).

The results of the 2009 Health and Wellbeing Survey and 2009 Social Capital Survey ${ }^{33}$ (which included questions on risk factors amongst other questions) are combined (see Table 5.17) in order to give a greater degree of precision due to the larger sample size, with a total of 5,757 respondents. This process means that the 2009 surveys can be reliably compared both with the results from the 2007 Health and Wellbeing Survey as well as with the most recent Health Survey for England. The percentage of adults recorded as obese increased in 2009, with $4 \%$ more Hull men and women obese in 2009 than in England 2008. The percentage of adults overweight or obese also increased in Hull, with 3\% more men and women in Hull in 2009 recorded as overweight or obese than in England 2008.

[^18]Table 5.17: Prevalence of overweight and obese adults from Hull's 2009 surveys with comparisons to the 2007 Health and Wellbeing Survey and 2008 Health Survey for England ${ }^{34}$, adjusted for age

| Risk factor | Survey | Age-adjusted percentages |  |  |
| :--- | :--- | :---: | :---: | :---: |
|  |  | Men | Women | All |
| Percentage of <br> adults obese | Hull 2007 | $19 \%$ | $23 \%$ | $21 \%$ |
|  | Hull 2009 | $26 \%$ | $26 \%$ | $26 \%$ |
|  | England 2008 | $25 \%$ | $25 \%$ | $25 \%$ |
| Percentage of <br> adults overweight <br> or obese | Hull 2007 | $68 \%$ | $56 \%$ | $62 \%$ |
|  | Hull 2009 | $69 \%$ | $60 \%$ | $64 \%$ |
|  | England 2008 | $67 \%$ | $58 \%$ | $62 \%$ |

Tables of data relating to exercise levels and the BMI of respondents broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in sections 10 and 11 on pages 120 and 128.

### 5.7 Employment

### 5.7.1 Paid employment

Just under half of all survey respondents were in paid employment (48.9\%), a higher percentage of men (53.1\%) compared to women (44.6\%). Figure 5.37 highlights those aged $25-44$ years had the highest percentage in paid employment ( $72.5 \%$ of men and $61.7 \%$ of women), compared with ages 18-24 years ( $43.0 \%$ of men and $41.2 \%$ of women). Low employment is expected for ages 18-24 years as some will be in full-time education.

Figure 5.37: Percentage in paid employment by gender and age band

West locality had the highest percentage of residents in paid employment (49.4\%), compared with North (49.0\%) and East localities (48.1\%). By Area Committee Area North Carr Area Committee Area had the highest percentage of residents in paid employment (57.5\%), compared to Riverside (West) Area Committee Area with the lowest (39.7\%). By deprivation (see Figure 5.38), the most deprived quintile had the highest percentage not working (63.7\%), decreasing with decreasing deprivation, with $36.9 \%$ of respondents not working in the least deprived quintile. Conversely the highest percentage of respondents in paid employment was in the least deprived quintile (63.1\%).

Figure 5.38: Percentage in paid employment by deprivation quintile

The percentage of respondents of working age in employment for 2009 was $60.4 \%$, a decrease of $11.2 \%$ on 2003 (see Figure 5.39). In comparison to national and regional data published in Social Trends $40^{35}$, the percentage of respondents of working age in employment is below both the Yorkshire and Humber Government Office Region for 2008 (73.0\%) and England for 2008 (72.7\%). Social Trends 40 reported Hull having the lowest employment rate within the region for 2008 ( $62.3 \%$ ). It should be noted Social Trends 40 includes those aged 16-17 years within working age, which can bias comparisons slightly.

[^19]Figure 5.39: Employment rates among respondents of working age (males 18-64; females 18-59), comparisons with previous local surveys and 2008 national and regional data

*Social trends 40 (males 16-64; Females 16-59)

Overall 62.9\% of respondents in paid employment worked full-time, a larger percentage of men ( $84.3 \%$ ) compared to women (37.5\%). Those aged 45-64 years had the highest percentage of full-time workers (68.2\%), with those aged 18-24 years the lowest ( $45.0 \%$ ). North locality had the highest percentage of residents in paid employment working full-time (67.6\%), compared with East (63.4\%) and West (60.1\%) localities. The percentage of respondents in paid employment by Area Committee Area ranged from 56.9\% in West Area Committee Area, to $72.3 \%$ in North Carr Area Committee Area. A similar percentage of respondents worked full-time across deprivation quintiles (see Figure 5.40). The middle quintile had the highest percentage of respondents working full-time ( $69.5 \%$ ), with the second least deprived quintile the lowest (60.1\%).

Figure 5.40: Percentage of full-time workers among those that work by deprivation quintile

### 5.7.2 Reasons for not working

Figure 5.41 displays the reasons for not working (if not in paid employment) by sub groups. Women were much more likely to be looking after the home or family ( $24.3 \%$ ) compared to men (4.2\%), while men were much more likely to be unemployed and looking for a job (25.2\%) compared to women (9.8\%). A larger percentage of men were not working due to long-term sickness or disability ( $14.9 \%$ ) compared to women ( $7.7 \%$ ). $43.5 \%$ of respondents were not working due to retirement ( $39.9 \%$ of men and $46.6 \%$ of women). There were no respondents in government training schemes.

Figure 5.41: Reasons for not working by sub groups

The majority of those aged 18-24 years and not working were in full-time education (53.9\%), with $25.3 \%$ unemployed. Those aged $25-44$ years had the highest percentage of respondents unemployed (37.2\%), with 35.7\% looking after the home or family. Those aged 45-64 years had the highest percentage of respondents not working due to long-term sickness or disability (27.1\%). East and West localities had the same percentage of respondents unemployed and looking for a job (17.1\%), whilst North locality had the lowest percentage of unemployed residents (16.0\%). North locality had the highest percentage of residents not working due to long-term sickness or disability (12.5\%), with East locality having the highest percentage retired (47.9\%). West locality had the largest student population, with $17.1 \%$ of residents in full-time education. There was considerable difference between deprivation quintiles in the percentage of respondents in full-time education, with $4.3 \%$ classed as students in the two most deprived quintiles combined, compared to $23.1 \%$ in the remaining quintiles.

Table 5.18 presents data from the 2007 and 2009 Health and Wellbeing Surveys with national data from Social Trends $40^{36}$ on reasons for not working (defined as economically inactive - that is they are not working, nor actively seeking work). The national data includes those aged 16-17 years, which can bias comparisons slightly. The percentage of working age men in 2009 economically inactive due to long-term sickness or disability was the same as the UK in 2009 (34\%), a decrease of 24\% between 2007 and 2009. 16\% of women in 2009 were economically inactive due to long-term sickness or disability, lower than the UK in 2009 (19\%), with a 20\% decrease between 2007 and 2009.

[^20]The fall in percentage not working due to long-term sickness or disability is large and surprising that it is the same or lower compared to the UK. One explanation may be a shift in policy over illness and disability benefits, with the government trying to get more people working through a change in procedures for claiming benefits. Another possible explanation is that as the percentage retired is higher in Hull compared to England respondents may have retired early due to illness or disability and answered they were not working due to retirement rather than illness or disability.

Table 5.18: Reasons for economic inactivity by age and gender comparisons with the United Kingdom 2008

|  | Reasons for economic inactivity (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Males(Hull: 18-64;UK 16-64) |  |  | Females(Hull: 18-59; UK 16-59) |  |  |
|  | $\begin{aligned} & \text { Hull } \\ & 2007 \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { Hull } \\ & 2009 \\ & \hline \end{aligned}$ | $\begin{gathered} \text { UK } \\ 2009 \end{gathered}$ | $\begin{aligned} & \text { Hull } \\ & 2007 \end{aligned}$ | $\begin{aligned} & \text { Hull } \\ & 2009 \end{aligned}$ | $\begin{gathered} \hline \text { UK } \\ 2009 \\ \hline \end{gathered}$ |
| Long-term sick/disabled | 45 | 34 | 34 | 20 | 16 | 19 |
| Looking after family/home | 8 | 9 | 6 | 55 | 53 | 45 |
| Student | 17 | 31 | 33 | 16 | 21 | 22 |
| Retired | 24 | 20 | 13 | 6 | 6 | 3 |
| Other | 6 | 5 | 11 | 3 | 4 | 9 |

Among men the percentage of students has nearly doubled between 2007 and 2009 to $31 \%$, to just under the UK in 2009 (33\%). There was a higher percentage of men looking after the family/home in 2009 ( $9 \%$ ) and retired ( $20 \%$ ) compared to the UK in 2009 ( $6 \%$ and 13\% respectively). The percentage of women looking after the family/home has remained relatively the same between 2007 and 2009 (53\%), higher than the UK in 2009 (45\%). The percentage of female students has increased between 2007 and 2009 by $31 \%$ to $21 \%$, just below the UK in 2009 (22\%). The percentage of women retired has remained the same between 2007 and 2009 (6\%), but still higher than the UK in 2009 $(3 \%)$. The significant rise in people going into full-time education could be related to a lack of employment opportunities, indicated by a fall in employment rates.

Tables of data relating to paid employment, employment rates among those of working age and reasons for unemployment broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 12 on page 130.

### 5.8 Ethnicity

The majority of survey respondents were White British (93.5\%), with 2.1\% White but not British and $4.5 \%$ non-White, compared to $11.8 \%$ in the UK classified as non-White for $2007^{37}$. A higher percentage of men (5.1\%) compared to women (3.8\%) were non-White. Those aged 18-24 years and 2544 years had the highest percentage of non-White respondents (14.3\% and $4.6 \%$ respectively) compared with those aged over 65 years (0\%). For categories of ethnicity see section 13.1 on page 138.

Figure 5.42: Geographical spread of respondents who were not White British

Figure 5.42 displays the geographical spread of respondents who were not White British. West locality was the most ethnically diverse locality, with $11.2 \%$ of residents not white British, including $8.6 \%$ non-white. East locality was the least ethnically diverse locality, with $2.4 \%$ of residents non-white British (1.1\% non-white). Wyke Area Committee Area was the most ethnically diverse Area Committee Area (see Figure 5.43) with $20.9 \%$ of residents not White British (17.8\% non-white). North Carr Area Committee Area was the least ethnically diverse, with $100 \%$ of respondents White British. By deprivation, the second least deprived quintile was the most ethnically diverse quintile with $10.5 \%$ not White British and $9.0 \%$ non-White respondents, whilst the middle quintile was

[^21]the least ethnically diverse, with $3.7 \%$ of respondents not White British and $1.6 \%$ respondents non-White.
Figure 5.43: Percentage of respondents who were not White British by Area Committee Area

Tables of ethnicity of respondents broken down by gender, age, locality, Area Committee Area and deprivation quintile can be found in section 13 on page 138.

## 6 Tables: General health

### 6.1 Self-reported health status

Table 6.1: Self-reported health status (Q1) by gender

| Gender | Number of respondents | Self-reported health status (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Excellent | Very good | Good | Fair | Poor | Don't know |
| Males | 877 | 12.1 | 27.3 | 36.9 | 14.1 | 9.4 | 0.2 |
| Females | 873 | 9.4 | 27.1 | 37.3 | 16.2 | 10.0 | 0.0 |
| All | 1750 | 10.7 | 27.2 | 37.1 | 15.1 | 9.7 | 0.1 |

Table 6.2: Self-reported health status (Q1) by age band

| Age (years) | Number of respondents | Self-reported health status (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Excellent | Very good | Good | Fair | Poor | Don't know |
| 18-24 | 266 | 12.8 | 38.7 | 35.7 | 9.4 | 3.4 | 0.0 |
| 25-44 | 647 | 15.5 | 33.8 | 35.9 | 9.1 | 5.7 | 0.0 |
| 45-64 | 522 | 7.7 | 19.3 | 39.8 | 19.2 | 13.8 | 0.2 |
| 65-74 | 166 | 4.8 | 20.5 | 40.4 | 22.3 | 11.4 | 0.6 |
| 75+ | 148 | 4.1 | 12.2 | 32.4 | 29.7 | 21.6 | 0.0 |

Table 6.3: Self-reported health status (Q1) by gender and age band

| Age <br> (years) | Number of <br> respondents | Self-reported health status (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Very <br> good | Good | Fair | Poor | Don't <br> know |  |

## 13 Tables: Ethnicity

### 13.1 Ethnic Group

Table 13.1: Ethnic group (Q20)

| Ethnic group | Number | Proportion |
| :--- | :---: | :---: |
| White British | 1,636 | 93.49 |
| White Irish | 3 | 0.17 |
| Any other White background | 33 | 1.89 |
| Mixed White \& Black Caribbean | 1 | 0.06 |
| Mixed White \& Black African | 5 | 0.29 |
| Mixed White \& Asian | 3 | 0.17 |
| Any other mixed background | 3 | 0.17 |
| Asian or Asian British Indian | 9 | 0.51 |
| Asian or Asian British Bangladeshi | 2 | 0.11 |
| Asian or Asian British Pakistani | 4 | 0.23 |
| Any other Asian background | 14 | 0.80 |
| Black or Black British Caribbean | 2 | 0.11 |
| Black or Black British African | 8 | 0.46 |
| Any other Black background | 1 | 0.06 |
| Chinese | 21 | 1.20 |
| Other ethnic group | 5 | 0.29 |
| Don't know | 0 | 0.0 |

### 13.2 Percentage white British

Table 13.2: Percentage of white British respondents (Q20) by gender

| Gender | Number of <br> respondents | White British (\%) |  |
| :---: | :---: | :---: | :---: |
|  |  | No |  |
| Males | 877 | 92.9 | 7.1 |
| Females | 873 | 94.0 | 6.0 |
| All | 1750 | 93.5 | 6.5 |

Table 13.3: Percentage of white British respondents (Q20) by age group

| Age <br> (years) | Number of <br> respondents | White British (\%) |  |
| :---: | :---: | :---: | :---: |
|  | 266 | Yes | No |
| $25-44$ | 647 | 81.2 | 18.8 |
| $45-64$ | 522 | 92.3 | 7.7 |
| $65-74$ | 166 | 97.7 | 2.3 |
| $75+$ | 148 | 100.0 | 0.0 |

Table 13.4: Percentage of white British respondents (Q20) by gender and age group

| Age <br> (years) | Number of <br> respondents | White British (\%) |  |
| :---: | :---: | :---: | :---: |
|  | No |  |  |
| $18-24$ | 135 | 83.0 | 17.0 |
| $25-44$ | 335 | 90.7 | 9.3 |
| $45-64$ | 270 | 97.4 | 2.6 |
| $65-74$ | 79 | 100.0 | 0.0 |
| $75+$ | 58 | 98.3 | 1.7 |
| Females |  |  |  |
| $18-24$ | 131 | 79.4 | 20.6 |
| $25-44$ | 312 | 93.9 | 6.1 |
| $45-64$ | 252 | 98.0 | 2.0 |
| $65-74$ | 87 | 100.0 | 0.0 |
| $75+$ | 90 | 100.0 | 0.0 |

Table 13.5: Percentage of white British respondents (Q20) by Area Committee Area and locality

| Area Committee <br> Area/ locality | Number of <br> respondents | White British (\%) |  |
| :--- | :---: | :---: | :---: |
|  | Yes | No |  |

[^0]:    ${ }^{1}$ Quota sampling involves calculating the numbers for each age, gender, geographical group in Hull's population and fixing a number of people to the survey for each group for the company doing the fieldwork, so the number surveyed for each group is the same proportion to Hull's population.

[^1]:    ${ }^{2}$ A survey of 4,808 British men and women aged 35-76 which compared self-reported and measured height and weight (Spencer et al. 2002), found that height was overestimated by on average 1.23 cm for men and 0.60 cm for women, but the extent of the overestimation was greater in older men and women, shorter men and heavier women. They also found that weight was underestimated by on average 1.85 kg for men and 1.40 kg for women and the extent of the underestimation was greater in heavier men and women, but did not vary with age or height (although other studies have found that the elderly particularly underestimate their weight (Jalkanen et al. 1987; Kuczmarski et al. 2001).
    ${ }^{3}$ For simplicity same differences applied to all men and women as even though it is known to differ depending on age, gender and weight the exact information was not given in the article abstract so could not be applied to the local data.

[^2]:    ${ }^{4}$ Communities and Local Government (2007). Local quintiles used because all Hull wards are in the 2 most deprived quintiles nationally.
    ${ }^{5}$ Missing due to incorrect or missing postcodes.

    ${ }^{12}$ Days per week
    ${ }^{13}$ Days per month

[^7]:    14 See 2007 Hull Health and Wellbeing Alcohol Report for in-depth analysis of alcohol consumption in Hull, available on request.

[^8]:    ${ }^{15}$ Analysis carried out by Liverpool John Moores University found the discrepancy between alcohol surveys calculating consumption and actual alcohol sales equals 430 million units a week in the UK. This is the equivalent of a bottle of wine per adult drinker per week going unaccounted for in the UK.

[^9]:    16 The 2007 Health and Wellbeing Survey defined units consumed by risk status.
